

Success Story

# Driven To Keep Data Performing At Optimal Speed

 by WellData | 2 minute read

## Background

Our client is a software and services company - operating since 1990, as a world-leading fleet risk and driver safety management provider of a renowned software package. The application is distributed to large organisations who manage fleet vehicle drivers. Our client also delivers fleet risk health checks, driver assessments and training services in over 95 countries.

## The Challenge

The client's flagship application which features a SQL Server database backend and entity framework based application, was deteriorating under a growing volume of data and some legacy application artifacts.

The company was desperate to reduce the volume of data held in the database and improve performance to provide the best user experience.

## The Solution

WellData has been working collaboratively with the client and their development partners in the tuning of the database to drive improvements in user experience.

Working within their Agile DevOps team, WellData has taken the lead in re-writing queries, tuning indexes and identifying data archiving opportunities, whilst providing invaluable advice with a human approach.

**500gb** of unnecessary data removed from database.

## The Results

WellData has directly improved the speed of key dashboards within the software and reduced load on the server making for a more available, stable and most importantly faster environment.
